

HERE to THERE

Find your way through the event crowd

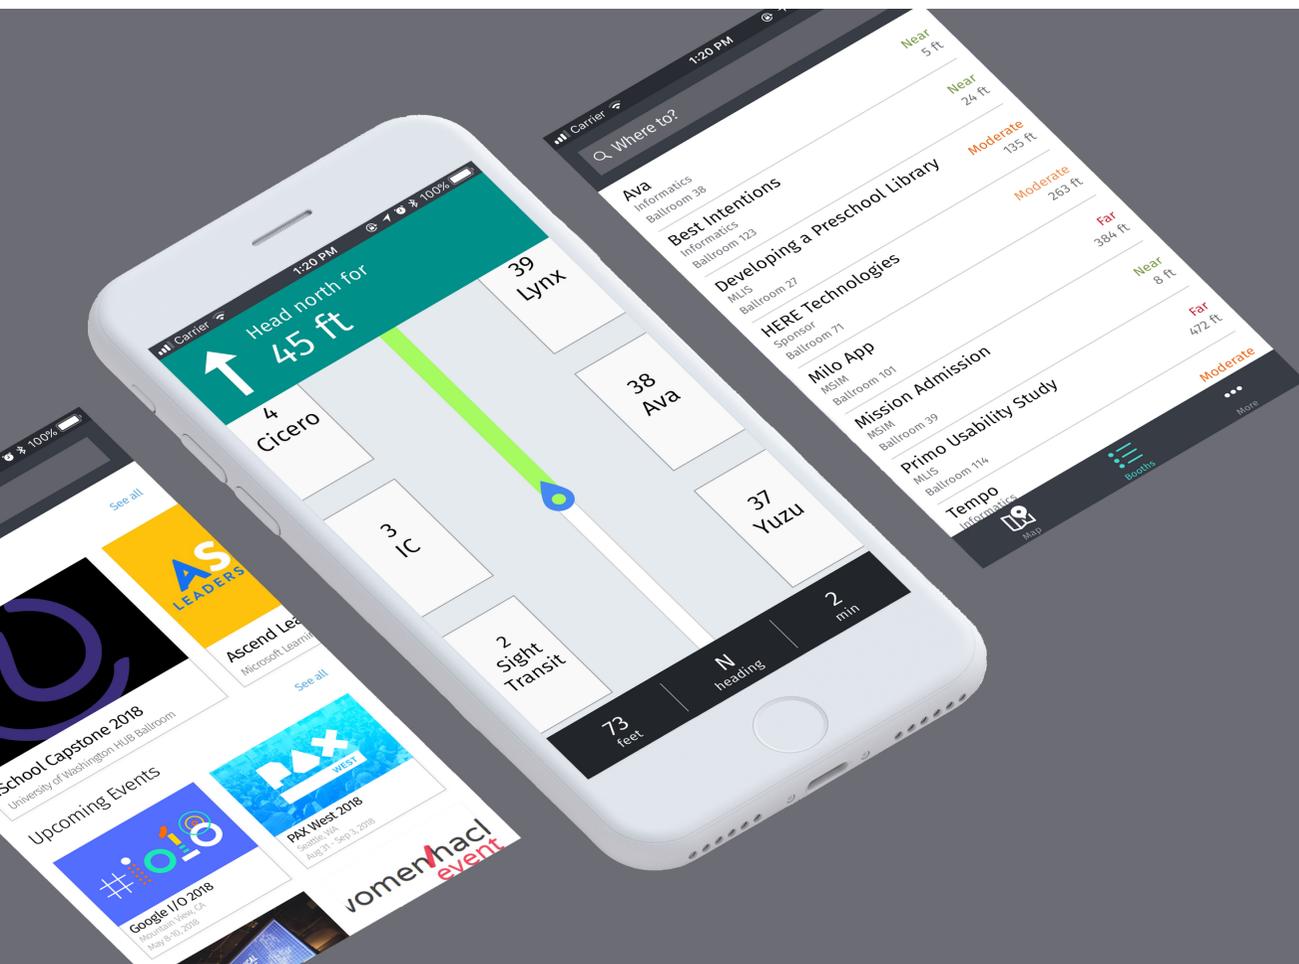

We use interactive maps to navigate outdoors

Yet we use static maps for indoor events

We are here to fix this gap with Wi-Fi and Bluetooth

Event Attendees

Reliability. With Wi-Fi signals, Bluetooth beacons, and the HERE Location API, we are able to show the user's location in event spaces where GPS signals are not available.

Convenience. The map from the HERE Location API allows users to easily view the overall layout of the event space from the comfort of their own mobile phones.

Knowledge. Each booth has its own information provided by event organizers and vendors that is easily searchable so the user no longer has to be in the dark.

Navigation. Our mobile application, THERE, has reliable turn-by-turn navigation to allow users to arrive at their end destination efficiently.

Event Organizers

Accurate. Like our iOS mobile application THERE, our web application provides accurate location information to provide a smooth user experience for event attendees.

Organized. We keep and manage all of our organizer's events in a reliable and secure database to prevent data loss.

Accessible. Our event organizers only need an internet connection and a computer to plan their event.

Seamless. Our web application makes it easy to create and edit event locations so organizers can spend less time learning the tool and more time planning a memorable event.
