Why Search Twice?
Making Your Web History Useful

Problem
Web history is supposed to show users where they've been and help them find websites they've visited.

Browser history is currently a dense list which doesn't reflect how users actually browse and remember the web.

Solution
Graphs, trends, and page relationships give users insight into how they use the web.

Visual search shows relevant results in context.

How It Works
Data collected via Chrome Extension
Data processed by our service
Visualizations in users' browser

Future Steps
• Search over collected data
• Discover new websites based on previous browsing activity
• Improve usability through user feedback
