# Why Search Twice?
Making Your Web History Useful

Problem

Web history is supposed to show users where they've been and help them find websites they've visited.

Browser history is currently a dense list which doesn't reflect how users actually browse and remember the web.

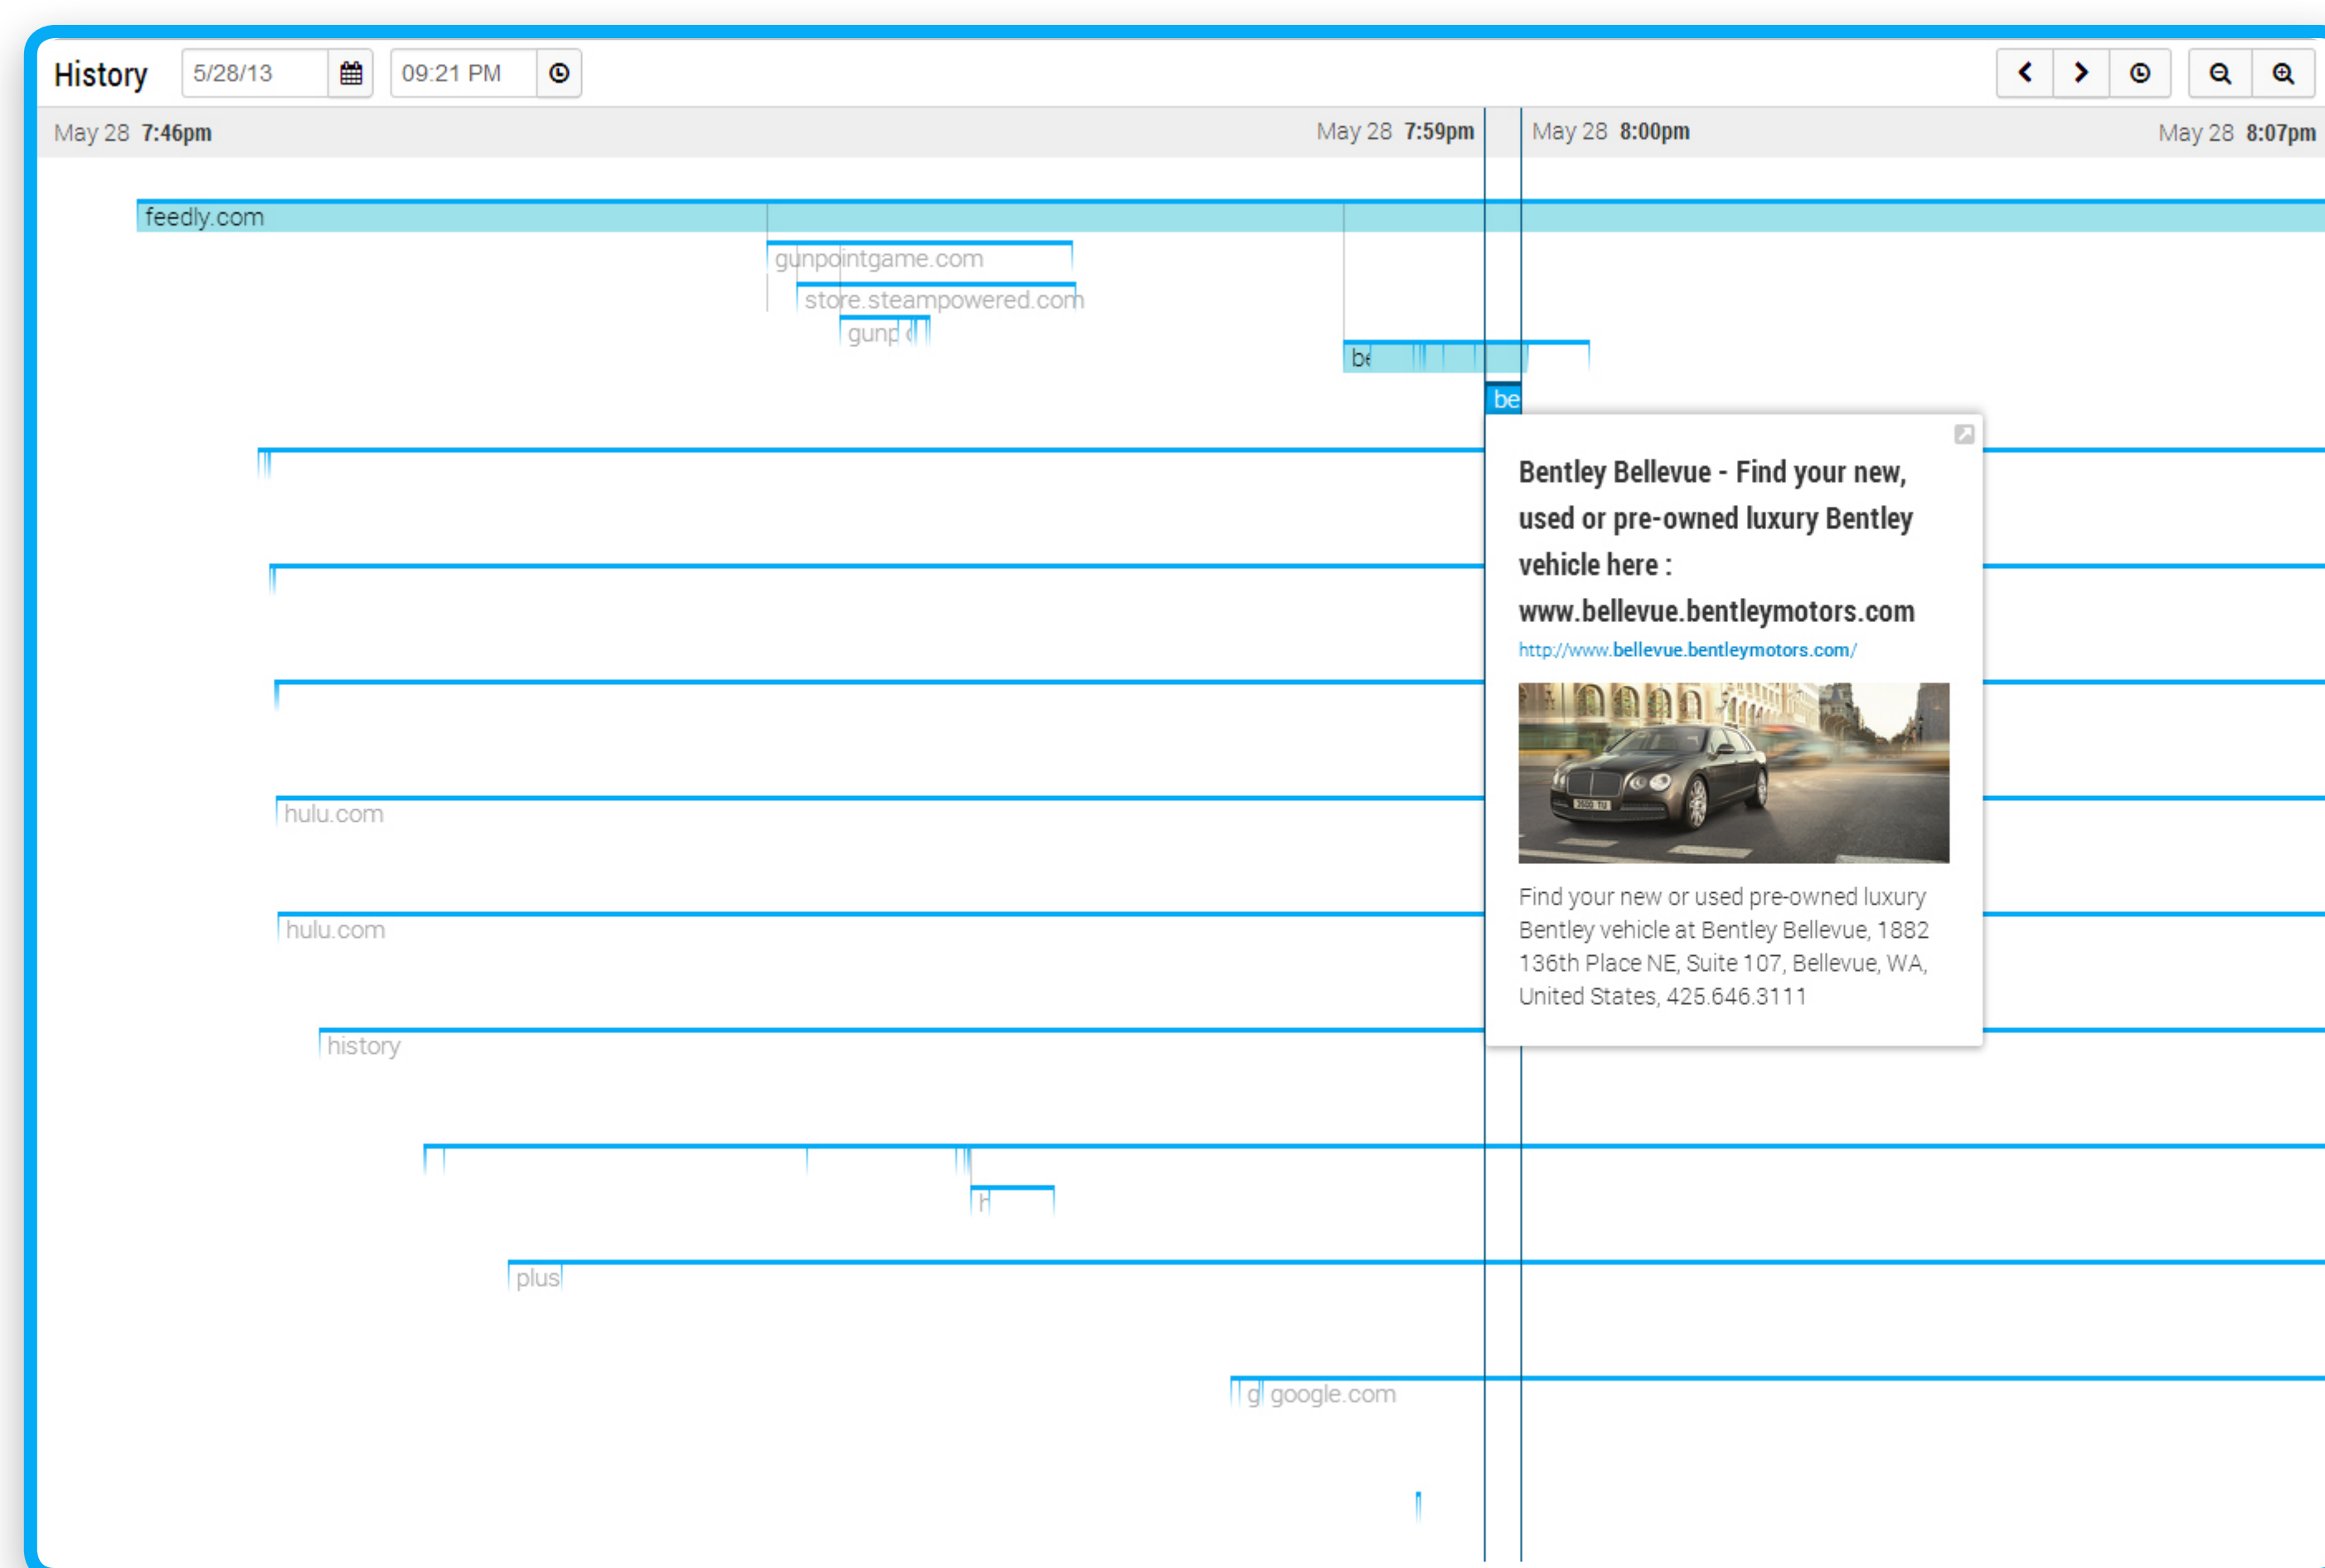

Our service takes browsing data and visualizes it.

Solution

Graphs, trends, and page relationships give users insight into how they use the web.

Visual search shows relevant results in context.

How It Works	Data collected via Chrome Extension	Data processed by our service	Visualizations in users' browser

Future Steps

• Search over collected data
• Discover new websites based on previous browsing activity
• Improve usability through user feedback
